

Event Guest Management System

A fully automated guest management pipeline — from invitation and seat reservation to real-time capacity monitoring, 1-week confirmation reminders, and instant cancellation handling. Guests just click. The system handles everything else.

What it does	Manages event invitations, seat reservations, confirmations, and cancellations automatically
Tools used	JotForm · Make (Integromat) · Google Sheets · Gmail · Webhooks
Who benefits	Anyone organising events who wants guest management to run on autopilot
Key features	Capacity checking · Auto-emails · 1-week reminders · Yes/No confirmation · Cancellation alerts
Built by	Sydney Rey De Leon · AI & Automation Specialist

What Is This Project?

Organising an event with many guests is a lot of work. You have to send invitations, track who's coming, manage how many seats are left, follow up closer to the event date, handle last-minute cancellations, and update your guest list after every change. Do all of that manually and something will eventually slip through.

This system automates the entire guest journey — from the moment an invitation is sent to the final seating arrangement before the event. Guests receive personalised emails, click a button to confirm or cancel, and the system updates the guest list, checks seat availability, and notifies the organiser of anything that needs attention. **Everything happens automatically, in real time.**

3	0	Live	1wk
Automation Flows	Manual Updates	Capacity Check	Pre-Event Alert
Registration, Reminders & Webhook Responses	Guest list updates itself automatically	Seat count checked the moment anyone registers	Confirmation reminder sent 1 week before the event

DESIGN PHILOSOPHY: Every tool in this system was chosen with the guest in mind. JotForm and Gmail are two of the most widely used smartphone applications today — familiar, fast, and accessible on any device. No guest was asked to download anything new or create an account. The entire guest experience fits inside two apps they already use every day.

The 3 Automation Flows

This system is made up of three separate automations that work together. Each one handles a different part of the guest journey:

Flow 1 · Guest Registration & Seat Reservation

Triggered the moment a guest submits the invitation form. Saves their details, checks seat availability, and sends the right email — either a confirmation or a full-capacity notice.

Flow 2 · Scheduled 1-Week Confirmation Reminder

Runs automatically every 15 minutes, checking if the event is 1 week away. When it is, it pulls the confirmed guest list from Google Sheets and sends each guest a personalised email asking them to confirm or cancel their seat.

Flow 3 · Webhook — Yes/No Button Response Handler

Fires when a guest clicks Yes or No inside their confirmation email. Updates the guest list in real time, sends a thank-you note, checks if the seat count is at capacity, and notifies the organiser of any cancellations.

Flow 1 — Registration & Seat Reservation

This is the first thing that happens when a guest fills out the invitation form. Here's every step from their submission to the email they receive:

1

Guest fills out the JotForm invitation

The guest receives an invitation link and clicks through to a JotForm. They enter their name, contact details, and how many seats they'd like to reserve for the event.

2

Their details are recorded in Google Sheets

The moment the form is submitted, the system automatically adds a new row to the guest list spreadsheet. Name, email, number of seats — all saved instantly with no manual entry needed.

3

The system checks how many seats are still available

Before sending any email, the system reads the current total from the spreadsheet to see if there are still open seats. This check happens in real time, every single time.

4

The right email is sent based on availability

If seats are available: the guest receives a warm confirmation email letting them know their reservation is secured. If the event is fully booked: they receive a polite notification that no seats remain — but they're warmly welcomed to attend as a standee if they still wish to come.

■ SEATS AVAILABLE

Confirmation email sent

- Guest's reservation is confirmed
- Email includes seat count and event details
- Guest list updated with status: Reserved

■ FULLY BOOKED

Capacity notice sent

- Guest notified no seats remain
- Offered the option to attend as a standee
- Organiser can monitor standee interest

Flow 2 — Scheduled 1-Week Confirmation Reminder

One week before the event, every confirmed guest receives a personalised email asking them to confirm or cancel their seat. This gives the organiser time to finalise the seating arrangement before the day arrives.

1

The system runs on a set schedule

This automation is scheduled to run automatically at a set date and time — specifically 1 week before the event. When the scheduled time arrives, it activates and begins pulling the guest list for the confirmation round.

2

It pulls the full confirmed guest list from Google Sheets

Once the 1-week mark is reached, the system reads the spreadsheet and collects the details of every guest who has a confirmed reservation — their name, email, and seat count.

3

A personalised confirmation email is sent to each guest

Each guest receives an email addressed to them personally. The email explains that the event is coming up in one week and asks them to confirm whether they will still be attending. Inside the email are two simple buttons: **Yes, I'll be there** and **No, I need to cancel**.

Why 1 week before? Last-minute cancellations are harder to fill. By collecting confirmations 7 days out, the organiser has enough time to adjust the seating plan, offer freed-up seats to others on a waiting list, or update the venue.

Flow 3 — Webhook: Yes/No Button Response Handler

When a guest clicks Yes or No in their confirmation email, a webhook fires instantly and the system handles everything that needs to happen next — automatically.

1

Guest clicks a button inside the confirmation email

The email contains two clickable buttons — one to confirm attendance and one to cancel. Each button is connected to a unique webhook link. The moment a guest clicks either one, the system receives the signal and begins processing.

2

A thank-you note is sent back immediately

Regardless of whether they clicked Yes or No, the guest immediately receives a brief, friendly response acknowledging their choice. This confirms to them that their response was received and recorded.

3

The guest list in Google Sheets is updated in real time

The system finds that guest's row in the spreadsheet and updates their status — either marking them as Confirmed (Yes) or Cancelled (No). The guest list stays accurate and up to date at all times.

4

The system checks what happens next based on their answer

From here, the system splits into two paths depending on whether the guest confirmed or cancelled. Each path triggers different follow-up actions.

■ GUEST SAID YES

Confirmed — check if seat is still available

- Guest status updated to: Confirmed
- System checks total reserved seats against capacity
- If capacity is full: organiser notified by email
- If seats still available: no further action needed

■ GUEST SAID NO

Cancelled — organiser is notified

- Guest status updated to: Cancelled
- System searches for their row in Google Sheets
- An email is sent to the organiser: guest has cancelled
- Freed seat becomes available for reassignment

Capacity check on every confirmation: Even when a guest says Yes, the system verifies the total seat count hasn't exceeded capacity — because another guest may have just confirmed at the same time. If the venue is now full, the organiser is immediately notified so they can manage the situation proactively.

The Tools Working Together

Five tools handle everything behind the scenes. Once set up, they run completely on their own:

JotForm — The invitation form

J

JotForm is where it all begins. Guests receive a link to a beautifully designed online form where they enter their name, contact details, and the number of seats they'd like to reserve. The moment they submit, the automation kicks in.

Make (Integromat) — The automation engine

M

Make is the platform that connects all the tools and runs every automation. It watches for form submissions, runs on a timer for reminders, and listens for webhook responses — all in the background, 24/7.

Google Sheets — The live guest list

G

Every reservation, update, and cancellation is recorded in a Google Sheet. It acts as the real-time database for the entire system — seat counts are read from here, and guest statuses are written back here after every change.

Gmail — The messenger

G

All emails — reservation confirmations, fully-booked notices, 1-week reminders, and cancellation alerts — are sent through Gmail automatically. Every message is personalised and goes out the moment it's needed.

Webhooks — The Yes/No listener

W

When a guest clicks Yes or No in their reminder email, a webhook captures that click instantly. It tells the system exactly who responded and what they chose, so the right follow-up action fires without any delay.

Why This Matters for Your Event

Every part of this system replaces something that would otherwise require manual effort. Here's what you get:

No guest is ever left without a response

- ✓ Whether a seat is available or not, every guest receives an email the moment they submit the form. No one wonders if their reservation went through.

Your seat count is always accurate

- ✓ The system checks capacity in real time on every registration and every confirmation. You'll always know exactly how many seats are filled.

Confirmations happen without you lifting a finger

- ✓ The 1-week reminder goes out automatically to every confirmed guest. You don't need to remember to send it or track who has and hasn't responded.

Cancellations are caught and handled immediately

- ✓ The moment a guest cancels, the guest list is updated and you receive a notification. Freed seats can be reassigned without any delay.

Every piece of data lives in one place

- ✓ The Google Sheet is always up to date. No separate lists, no manual tracking, no outdated copies floating around. One sheet. One truth.

It scales to any event size

- ✓ Whether you're managing 20 guests or 200, the system handles every single reservation, confirmation, and cancellation exactly the same way.
